Duralumin is a type of high-strength aluminum alloy. The standard composition is aluminum with 4% copper and small amounts of magnesium and manganese. duralumin is heated to about 540°C, quenched in water, and left at room temperature for about 96 hours to gradually harden to a strength comparable to that of mild steel.

Duralumin is an extremely practical alloy because its density is about one-third that of steel while its strength is equivalent to steel. As aircraft have developed, improvements have been made, and higher-strength super duralumin and extra super duralumin have also been put to practical use.

The global Duralumin market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
