The global Dust Particle Centrifugal Separation Technology market size is predicted to grow from US$ 613 million in 2025 to US$ 792 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

Dust particle centrifugal separation technology refers to the process of using a high-speed centrifuge to spin the dust particles in the dust-laden gas under strong centrifugal force, so that they are thrown toward the side wall of the equipment or a specific collection device, achieving effective separation of dust particles from the gas. This process mainly relies on the difference in density between the dust particles and the surrounding gas, accelerating sedimentation in the centrifugal field to achieve the purpose of separation. Dust particle centrifugal separation technology is a separation technology based on the principle of inertial centrifugal force and material density difference.
