The dust removal ventilation system mainly consists of a dust hood, an air duct, a dust collector and a ventilator. Its main working principles include two aspects: air exhaust and air inlet. The exhaust process is to guide the indoor polluted air into the air purification equipment through the exhaust system, remove the pollutants through filtration, dust removal, purification and other processes and then discharge it outdoors; the air intake process is to send fresh air through the air inlet system indoors, for people to breathe and use.

The global Dust Removal Ventilation System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
