A dye-sublimation printer is a computer printer which uses heat to transfer dye onto materials such as a plastic, card, paper, or fabric. Dye-sublimation uses a printing technique that diffuses dye onto paper. This dye comes in the form of a ribbon, which is converted into a diffused gas when heat is applied, and the dye is absorbed by a special receiving layer on the paper. The print head heats very accurately to vary temperatures, creating different shades of color based on the amount of heat applied. Then the dye layers are sealed into the paper and the image is protected against UV light, fingerprints, and even water.
