The global Dynamic Adaptive Radiotherapy market size is predicted to grow from US$ 677 million in 2025 to US$ 1202 million in 2032; it is expected to grow at a CAGR of 8.7% from 2026 to 2032.

Dynamic Adaptive Radiotherapy is an advanced radiotherapy technology. Its core lies in obtaining real-time or regular information on the anatomical structure, position and biological characteristics of the tumor and surrounding tissues in the patient's body during the treatment process, and using intelligent algorithms and image-guided technology to dynamically adjust the radiotherapy plan (including irradiation dose, target range, field angle and other parameters) to respond to physiological changes such as tumor shrinkage, deformation, displacement or organ movement (such as breathing, gastrointestinal motility), ensuring that high-dose radiation always accurately covers the tumor area while reducing radiation damage to surrounding normal tissues. Its essence is to combine multimodal imaging (such as MRI, CBCT, PET-CT) with automated plan optimization technology to achieve a paradigm shift from "static treatment" to "dynamic response", significantly improving the accuracy and individualization of radiotherapy, especially for cases such as prostate cancer, lung cancer, head and neck tumors that are greatly affected by anatomical changes.

United States market for Dynamic Adaptive Radiotherapy is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
