Dynamic Climbing Ropes are elastic ropes designed for rock climbing, mountaineering and high-altitude exploration. They have high ductility to absorb and disperse the impact force generated during a fall, thereby reducing the impact on the climber and the anchor system. Dynamic climbing ropes are usually made of high-strength nylon fibers and use a double-layer structure of an inner core (core strands) and an outer braid (sheath) to increase durability, flexibility and abrasion resistance. These ropes are widely used in sport climbing, traditional climbing, ice climbing and big rock climbing, and their dynamic characteristics are crucial to reducing fall injuries.
