Dynamic hip screw (DHS) or Sliding Screw Fixation is a type of orthopaedic implant designed for fixation of certain types of hip fractures which allows controlled dynamic sliding of the femoral head component along the construct. One common use is internal fixation of intertrochanteric fractures of the femur, which are common in older osteoporotic patients.

The market was witnessing advancements in implant materials and design for dynamic hip screws, with a focus on improved biocompatibility, enhanced implant durability, and innovative screw configurations. Manufacturers were developing dynamic hip screws with specialized materials, such as titanium alloys, that offered a combination of strength, biocompatibility, and reduced interference with diagnostic imaging. Additionally, advanced screw designs were being introduced to promote improved compression, reduced stress risers, and better overall fracture stabilization.
