A dynamic mixing nozzle is a device used to mix and dispense two or more-part adhesives and sealants. The nozzle typically consists of an outer chamber that houses the two different components of the adhesive or sealant, and an inner chamber that includes a series of helical mixing elements. When the two components are forced through the nozzle, they are thoroughly mixed by the mixing elements, resulting in a homogenous mixture that is then dispensed onto the intended surface. Dynamic mixing nozzles are used in a variety of applications, including automotive and aerospace

assembly, construction, and manufacturing of electronic devices. They are often essential to optimizing the performance and durability of adhesives and sealants in demanding environments.
