Dynamic signature is a biometric modality that uses anatomic and behavioural characteristics that an individual exhibits when signing for recognition purposes. Dynamic signature captures direction, stroke, pressure, and shape of an individual's signature. Dynamic signature recognition uses multiple characteristics in the analysis of an individual's handwriting. These characteristics vary in use and importance from vendor to vendor and are collected using contact sensitive technologies, such as PDAs or digitizing tablets. Most of the features used are dynamic characteristics which are analysed in the X, Y, and Z directions. The X and Y position are used to show the changes in velocity in the respective directions while the Z direction is used to indicate changes in pressure with respect to time. Some dynamic signature recognition algorithms incorporate a learning function to account for the natural changes or drifts that occur in an individual's signature over time.
