## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The earth tester is a commonly used instrument for measuring and measuring the grounding resistance, and is used to measure the grounding resistance or the resistance of the ground electrode and the soil resistivity. The power system equipment is grounded through the ground electrode. Since the ground resistance will be very low if any fault current occurs, it will be transferred to the ground through the ground electrode or tester. In addition, it protects systems and personnel from high current damage. It is also an indispensable tool for electrical safety inspection and ground engineering completion acceptance. In recent years, due to the rapid development of computer technology, the ground resistance tester has also penetrated a large number of microprocessor technologies.
