EC Ballast Water Management System is an advanced marine environmental technology designed to treat and disinfect ballast water in compliance with international regulations such as the IMO Ballast Water Management Convention and the U.S. Coast Guard standards. This system uses electro-catalytic oxidation processes to eliminate or neutralize aquatic invasive species, pathogens, and microorganisms that may be present in ballast water taken on by ships. The EC method typically involves generating reactive oxidative species (e.g., hydroxyl radicals, ozone, hydrogen peroxide) through electrode reactions, without the need for chemical storage or post-treatment neutralization. Compared to traditional chemical or UV-based systems, EC systems offer advantages such as reduced operational complexity, minimized chemical handling, lower environmental impact, and effectiveness in various water conditions, including high turbidity or salinity.
