The global ECG Analog Front-End (ECG AFE) market size is predicted to grow from US\$ 803 million in 2025 to US\$ 1583 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

In 2024, the global production of ECG analog front-ends was estimated at 100 million to 250 million units, with an average selling price of approximately US\$0.8 to US\$12 per unit and a gross profit margin of about 60%. Single-line production capacity was estimated at 500,000 to 1 million units per year. An ECG analog front-end is a highly integrated application-specific integrated circuit (ASIC) or module located at the very beginning of the signal chain. It is responsible for interfacing with human electrodes and performing all critical tasks from analog ECG signal acquisition and conditioning to digital output, providing high-quality, usable ECG data for subsequent digital processing systems. The upstream sector comprises semiconductor materials, wafer manufacturing, and chip design; the midstream sector includes AFE chip manufacturing, packaging and testing, and module integration; and the downstream sector comprises the manufacturing of medical devices, consumer electronics, and other end-products. The demand fundamentally stems from the explosive growth of downstream applications: the upstream is driven by the growth of the medical diagnostics and health management market; the midstream sector responds to the downstream demand for miniaturized and intelligent devices; and the continued surge in downstream demand is directly driven by the deepening global aging population, increased awareness of personal health management, and the widespread adoption of telemedicine.
