The ECG electrode is the part of the ECG machine or ECG monitor that is connected or in contact with the body. Through the ECG electrode, the electrical activity generated by the beating of the heart can be conducted to the ECG device and then converted into an ECG waveform, thereby diagnosing diseases. and guide treatment. There are two types of ECG electrodes: disposable and reusable. Disposable electrodes are metal films that can be directly attached to different parts of the body and are mainly used for ECG monitoring. Reusable electrodes are mainly used during ECG examinations and are part of the ECG machine.

Electrocardiogram generally has 12 electrodes, including 6 limb leads, namely I, II, III, aVL, aVF, aVR, and 6 chest leads, namely V1, V2, V3, V4, V5, V6. Lead V1 is red, and the probe electrode is placed in the 4th intercostal space on the right sternal border. Lead V2 is yellow, and the probe electrode is placed in the 4th intercostal space on the left side of the sternum. Lead V3 is green, and the probe electrode is placed at the midpoint of the line connecting V2 and V4. Lead V4 is brown, and the probe is placed at the intersection of the midclavicular line and the fifth intercostal space. Lead V5 is black, and the probe electrode is placed at the intersection of the left anterior axillary line and the fifth intercostal space. Lead V6 is purple, and the probe is placed at the intersection of the left midaxillary line and the fifth intercostal space.
