The global ECM-derived Biomaterials market size is predicted to grow from US\$ 41.42 million in 2025 to US\$ 70.24 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

Extracellular matrix (ECM)-derived biomaterials are biological scaffolds created from the ECM of tissues, providing structural and biochemical support for cells. The ECM is a complex network composed of proteins, glycoproteins, and other molecules that form a supportive environment for cell attachment, growth, and differentiation. ECM-derived biomaterials are produced by decellularizing tissues to remove cellular components while preserving the ECM structure. These biomaterials are used in tissue engineering and regenerative medicine because they mimic the natural environment of tissues, promoting tissue repair and regeneration. They have been applied in a variety of medical fields, including wound healing, organ repair, and reconstructive surgery, due to their ability to support cell proliferation and integration into host tissues?.

United States market for ECM-derived Biomaterials is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
