ED (Electrodeposited) copper foil manufacturing equipment consists of specialized machinery used to produce high-quality copper foil through an electrodeposition process. This equipment includes electrolytic plating baths where copper ions are deposited onto a rotating drum or belt, forming a thin, uniform copper layer. Key components of the equipment typically include a rectifier for controlling the electrical current, anode and cathode systems, solution filtration and circulation systems, and tension control systems for the foil. The process results in copper foil with excellent conductivity, mechanical properties, and surface finish, which is essential for applications in printed circuit boards (PCBs), lithium-ion batteries, and electromagnetic shielding. ED copper foil manufacturing equipment ensures precise control over thickness, grain structure, and other critical parameters, enabling the production of foils that meet stringent industry standards.

The global ED Copper Foil Manufacturing Equipment market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
