Electronic Design Automation (EDA) is primarily a software business. Very sophisticated and complex software programs function primarily in one of three ways to assist with the design and manufacture of chips:

Simulation tools take a description of a proposed circuit and predict its behavior before it is implemented.

Design tools take a description of a proposed circuit function and assemble the collection of circuit elements that implement that function. This is both a logical process (assemble and connect the circuit elements) and a physical process (create the interconnected geometric shapes that will implement the circuit during manufacturing). These tools are delivered as a combination of fully automated and interactively guided capabilities.

Verification tools examine either the logical or physical representation of the chip to determine if the resultant design is connected correctly and will deliver the required performance.

The global EDA Tools for Digital IC Design market size is projected to grow from US\$ 3889 million in 2024 to US\$ 5752 million in 2030; it is expected to grow at a CAGR of 6.7% from 2024 to 2030.
