The Eddy Covariance System is a high-precision observation system used to directly measure the energy and material exchange between the surface and the atmosphere (such as fluxes of carbon dioxide, water vapor, methane, etc.). It is mainly composed of a three-dimensional ultrasonic anemometer, a fast gas analyzer, and a data acquisition system. The system obtains instantaneous flux data by synchronously recording the changes in wind speed and gas concentration at high speed and calculating their covariance values. It is widely used in ecology, climate, agriculture, and environmental sciences to study key processes such as carbon cycle, water cycle, and greenhouse gas emissions.

United States market for Eddy Covariance Systems is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Eddy Covariance Systems is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
