The global Edge AI System market size is predicted to grow from US$ 2261 million in 2025 to US$ 3864 million in 2031; it is expected to grow at a CAGR of 9.3% from 2025 to 2031.

Edge AI System is a system that combines artificial intelligence (AI) technology with edge computing to process and analyze data on edge devices close to data sources or data generation. Sensors, cameras, etc. on edge devices collect various data, such as environmental data, images, audio, etc. Optimized AI models, such as machine learning and deep learning algorithms, are deployed on edge devices to analyze and process the collected data in real time and extract valuable information. Based on the processing results of the AI ??model, the edge device directly makes decisions and performs corresponding operations, or transmits the processed data to the cloud or other central systems for further processing and analysis.

Through technologies such as model compression and knowledge distillation, large deep learning models are compressed into smaller models so that they can run on resource-constrained end-side devices. Dedicated AI chips, such as NPU, GPU, etc., as well as heterogeneous computing technologies are used to utilize the collaborative work of multiple computing resources to improve computing power. Including distributed computing and task scheduling, efficient resource utilization and task processing between multiple devices are achieved, and tasks are dynamically allocated and adjusted according to device resource status and task priority.

The increasing requirements for real-time and privacy in smart manufacturing, smart

cities, smart healthcare, smart transportation and other fields will continue to drive the growth of market demand for edge AI systems.

Technologies such as model compression, quantization, and pruning will continue to develop, making AI models lighter and more efficient, and running better on resource-constrained edge devices. Technologies such as adaptive learning and federated learning will be further improved, allowing edge AI systems to continuously optimize based on new data. Dedicated AI chips will continue to upgrade to provide stronger computing power and lower power consumption. Heterogeneous computing technology will be more widely used to achieve efficient collaboration of multiple computing resources such as CPU, GPU, and NPU. The popularization of 5G and even 6G networks will make communication between edge devices and with the cloud faster and more stable, reduce latency, and improve the overall performance of edge AI systems. At the same time, the collaborative computing mode between edge devices and the cloud will continue to be optimized to form a more efficient computing system.

In self-driving cars, vehicle sensor data is processed in real time to achieve functions such as automatic emergency braking and lane keeping assist. Smartphones use edge AI to implement voice recognition and natural language processing for smart assistants, as well as real-time beautification, filters, and object recognition for photos and videos. It is used for smart security, real-time analysis of videos captured by cameras, face recognition, abnormal behavior detection, etc.; it can also achieve intelligent control, such as automatically adjusting light brightness according to ambient light. Real-time analysis of images and data on the production line for defect detection and quality assessment; local data processing to predict equipment failures and perform maintenance in advance. Wearable medical devices locally process health data such as heart rate and blood pressure, and provide real-time health advice and warnings; medical instruments use edge AI to achieve ultra-low latency live surgical video to assist minimally invasive surgery.
