The global Edge Bead Removal (EBR) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Edge Bead Removal (EBR) refers to a process in semiconductor manufacturing that removes excess coating at the edge of a wafer. During the spin-coating of photoresist onto a wafer, a thicker layer or 'edge bead' often forms due to the physical nature of the spin process. If these edge beads are not removed, they can lead to defects in subsequent processing steps, such as coating uniformity issues, decreased lithographic pattern resolution, and even affect the overall planarity and functionality of the wafer. Therefore, EBR is a crucial step in ensuring wafer manufacturing quality.

United States market for Edge Bead Removal (EBR) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
