Edge position control systems are devices designed to identify boundaries or transitions between different surfaces or materials within an environment. Employed in various industries such as robotics, computer vision, and manufacturing, these sensors use different technologies, including infrared, ultrasonic, or vision-based methods, to detect changes in physical properties such as texture, color, or depth. The primary purpose is to locate the edges or contours of objects, providing crucial information for navigation, object recognition, and quality control processes. Edge position control systems play a vital role in enhancing automation and precision in applications ranging from industrial machinery to autonomous vehicles, where accurate identification of object boundaries is essential for effective decision-making and control.
