The global EGR Pipe market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The EGR pipe refers to the Exhaust Gas Recirculation Pipe, which is a part of the exhaust gas recirculation system. The EGR pipe is connected to the engine's exhaust and intake pipes, used to guide a portion of the exhaust gas back into the engine's intake system. The function of the EGR pipe is to introduce the exhaust gas into the engine's intake pipe, in order to reduce the oxygen concentration in the combustion chamber and reduce the generation of nitrogen oxides (NOx). The exhaust gas recirculation system, guided by the EGR pipe, injects a portion of the exhaust gas back into the engine, thereby reducing combustion temperature and harmful gas emissions. EGR pipes are usually made of high-temperature and corrosion-resistant materials, such as stainless steel or cast iron. It needs to have good sealing performance and high temperature resistance to ensure that exhaust gas can be correctly directed back into the engine's intake system.

United States market for EGR Pipe is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
