An eight-channel wireless electromyograph is a device used to monitor and record the electrical activity of multiple muscle parts at the same time. It is usually equipped with eight independent sensor channels and transmits data to a computer or other display device via wireless technology. The instrument uses surface electromyography (sEMG) technology to capture the electrical signals of muscles and is widely used in sports science, rehabilitation therapy, sports medicine, and biomechanics research. It can monitor the activity of multiple muscle groups in real time, provide accurate muscle function assessment, and help optimize sports training, diagnose muscle diseases, and track rehabilitation progress.
