Elastomeric bridge bearing pads are components used in bridge construction to support and facilitate movement between the bridge deck and substructure. These pads are made from a durable and flexible elastomeric material that can absorb and distribute the forces and movements generated by the bridge's traffic and environmental conditions. By providing a cushioning effect, elastomeric bridge bearing pads help to reduce stress on the bridge structure and ensure its longevity and safety. They are designed to accommodate various types of movements, including rotation, translation, and expansion, allowing the bridge to adapt to changing conditions without compromising its structural integrity.
