The global Elastomeric Pain Pump market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

There is an elastic capsule in the elastic analgesic pump, and the analgesic liquid prepared by the doctor according to the individual differences of patients is filled in the capsule of the analgesic pump. The analgesic pump relies on elastic force, and routinely injects analgesic drugs into the intravenous cavity at a constant speed of 1-2 ml/hour. The locking time of the pump is generally 24 to 48 hours, and the indwelling time is determined according to the needs of the patient, and it can be left in place for a long time. During this period, doctors regularly follow up, supplement the liquid medicine, and check and record relevant conditions.

This therapy has the characteristics of less analgesic drug consumption, safety and easy control, and high analgesic effectiveness. It is of great significance for improving the quality of life of patients, improving their psychological conditions, avoiding intractable pain, and promoting the recovery of patients.
