An Electric Bus Pantograph System is a device used to charge electric buses by connecting them to overhead power lines or charging stations. The pantograph, typically mounted on the roof of the bus, extends upwards to make contact with a charging infrastructure, allowing for quick and efficient transfer of electrical power to the bus's battery.

There is a charging mode with the charging bow facing downward. This type of system, often referred to as an inverted pantograph or overhead charging system, involves a charging arm that is mounted on a mast or charging station rather than on the bus itself. When the bus is in position, the charging arm lowers to make contact with the bus's roof-mounted charging interface. This downward-facing charging bow system allows for quick and efficient energy transfer and is commonly used at bus stops or depots, enabling high-speed charging without requiring the bus to be equipped with extensive roof-mounted hardware. This setup is advantageous for reducing weight and complexity on the bus and facilitates rapid charging to maintain bus schedules in urban transit networks.

The global Electric Bus Pantograph System market size is projected to grow from US\$ 754 million in 2024 to US\$ 1270 million in 2030; it is expected to grow at a CAGR of 9.1% from 2024 to 2030.
