## Abstracts

The global Electric Compaction Tester market size is predicted to grow from US\$ 39.13 million in 2025 to US\$ 59.59 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

The electric compaction tester is a laboratory-based electric device used to determine the optimal moisture content and maximum dry density of engineering materials such as soil and asphalt under standard compaction conditions. It simulates the principle of on-site compaction and provides stable and compliant compaction energy. Its core function is to provide key design parameters (compaction standards) for the quality control of roadbed, foundation, and pavement materials, solving the problems of low efficiency, poor consistency, and high labor intensity of traditional manual compaction, thereby ensuring the uniformity, density, and long-term stability of the engineering fill. The upstream supply chain mainly includes suppliers of metal materials, motors and transmission components, sensors, and industrial control systems; the downstream supply chain directly serves construction, supervision units, third-party testing laboratories, and universities and research institutes of highways, railways, municipal works, and water conservancy, providing core data support for their material mix ratio design, construction quality control, and acceptance evaluation. It is a key tool connecting material design standards with the quality of physical engineering works. The production of electric compaction tester is expected to be approximately 5,000 units in 2025, with an average price of about \$8,000 per unit and a gross profit margin of approximately 30%. The single-line production capacity is 80 units per year.
