Abstracts

The global Electric Device Fabrication System market size is predicted to grow from US$ 111740 million in 2025 to US$ 194800 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

In 2024, global revenue for electronic device fabrication systems reached $105 billion, with significant variations in unit price.

An Electric Device Fabrication System is an integrated class of capital equipment used to fabricate electronic devices and micro/nano-structures on substrates. It typically bundles one or more process modules — such as lithography (patterning), thin-film deposition, etch/plasma processing, chemical mechanical planarization (CMP), thermal processing and in-line metrology/inspection — together with vacuum systems, process gases/chemistries, and automation for wafer handling. Upstream for these systems are semiconductor-grade raw materials and consumables, precision vacuum and motion hardware, high-voltage power supplies and optics/electron sources, plus software and control electronics. Downstream are the fabs, foundries and labs that produce ICs, power devices, LEDs, sensors, MEMS, optoelectronics and flexible electronics — the fabrication system is sold either as a standalone tool (deposition, etcher, litho stepper) or as integrated tool lines for production. Electronic device fabrication systems are built to order, with production capacity highly dependent on the complexity of the equipment and a typical gross profit margin of 30%–50%.

United States market for Electric Device Fabrication System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
