Electric pressure differential bypass valve is a key device used to adjust the pressure difference of the supply and return water main pipe in the central air-conditioning system. It maintains the system pressure difference stable by intelligently controlling the opening of the valve to ensure the normal operation of equipment such as refrigerators and heat exchangers. The valve is mainly installed between the manifold or on the supply and return water pipeline of the thermal pump. When the end load is reduced and the pressure difference fluctuates, the pressure differential controller achieves dynamic balance by adjusting the bypass flow. Its materials include cast steel and ductile iron, and it adopts electric drive. The operating temperature range is 0-80?, which is suitable for chilled water, hot water and low-pressure fluid systems.

United States market for Electric Differential Pressure Bypass Valves is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Electric Differential Pressure Bypass Valves is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
