Electric double-layer capacitors (EDLCs) are energy storage devices that have higher capacitance than other capacitors or batteries. Compared with batteries, these devices have higher power capacity, longer life cycle, and faster charging options. Instead of conventional dielectrics, EDLCs have two plates that are separated by electrolytes. These plates are layers of the same substrate. The electrical properties of these plates help to separate the charge effectively, which even highly thin physical layers cannot do. The absence of heavy dielectric materials in EDLCs eases the packaging with a larger surface area resulting in high capacitance. EDLCs can generate capacitance values in farads instead of microfarads and picofarads, which are the measurement units for capacitance.

The global Electric Double-layer Capacitor (EDLC) market size is projected to grow from US\$ 1817.6 million in 2023 to US\$ 5736.1 million in 2030; it is expected to grow at a CAGR of 17.8% from 2024 to 2030.
