Electric furnace ramming material, also known as electric furnace refractory ramming material, is a type of refractory material used in electric furnaces. It is used to line the walls and bottom of the electric furnace to protect it from high temperatures, chemical reactions, and mechanical wear. The ramming material is typically made from a mixture of refractory aggregates, binders, and additives. The aggregates are usually high-quality refractory materials such as alumina, magnesia, or silica, which have high melting points and can withstand the extreme temperatures inside the electric furnace. The binders help to hold the aggregates together and provide strength to the ramming material. Additives may be added to improve the workability, thermal shock resistance, and other properties of the ramming material.
