The global Electric Linear Cutting Stapler market size is predicted to grow from US\$ 707 million in 2025 to US\$ 1022 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

An electric linear cutting stapler is a powered surgical device used to simultaneously cut and staple tissue during open or minimally invasive procedures, particularly in gastrointestinal, thoracic, and bariatric surgeries. Unlike manual staplers, it features a motor-driven mechanism that delivers consistent clamping and firing force, enhancing precision and reducing variability in surgical outcomes. Its linear design allows for straight-line tissue transection and secure hemostasis, making it ideal for procedures requiring long, uniform cuts. Electric linear cutting staplers often support multiple reloadable cartridge sizes, provide better ergonomics for the surgeon, and are increasingly integrated with digital feedback systems for enhanced safety and efficiency in modern operating rooms.

The growth of the electric linear cutting stapler market is primarily driven by the rapid advancement of minimally invasive surgeries and the increasing surgical volume due to the high prevalence of gastrointestinal tumors and obesity. Compared to traditional manual devices, electric staplers offer superior clamping force and firing consistency, significantly improving anastomosis quality and intraoperative safety, making them increasingly favored by surgeons. As healthcare institutions focus more on enhancing surgical efficiency and reducing postoperative complications, electric devices are becoming essential components of standardized operating rooms. Additionally, technological advancements are steering products toward greater intelligence, visualization, and multi-indication applications. Coupled with factors such as government policies promoting domestic alternatives, accelerating aging populations,

and sustained surgical volumes in top-tier hospitals, the market size is steadily expanding.
