Motor Core (Iron core or magnetic core) plays a pivotal role in the entire motor. It is used to increase the magnetic flux of the inductor coil and has achieved the maximum conversion of electromagnetic power. And the motor core is usually composed of a stator and a rotor. The stator and rotor cores of electrical machinery are manufactured using thin sheets stacked together in order to minimize eddy current losses. The laminations are bonded in order to create a stable core. A general distinction is made between techniques integrated into the punching process (interlocking, full-face bonding or spot bonding) and those downstream from the punching process (welding, clamping, conventional bonding). In fact, most motor manufacturers choose to buy Stamping dies and Laminations, and produce iron cores by themselves.

The global Electric Motor Core market size is projected to grow from US\$ 16130 million in 2024 to US\$ 24790 million in 2030; it is expected to grow at a CAGR of 7.4% from 2024 to 2030.
