The global Electric Oil Scavenge Pump market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Electric Oil Scavenge Pump is a device used in the liquid circulation system of mechanical equipment such as turbochargers, engines, and transmissions to collect and transport oil. Its main function is to circulate the oil from the mechanical equipment back to the oil tank for reuse, ensuring the normal operation of the lubrication and cooling system inside the mechanical equipment. In the turbocharger system, the electric oil scavenge pump can return the oil from the turbine back to the oil tank to reduce the temperature of the turbine and increase its lifespan. In the engine and transmission system, the electric oil scavenge pump can recover the cooling and lubricating oil to ensure the normal operation and prolong the service life of the engine and transmission. The working principle of the electric oil scavenge pump is to use the built-in electric motor to drive the impeller to rotate, which generates negative pressure to suck up the oil and discharge it through the pump body. Compared with traditional mechanically driven scavenging pumps, electric oil scavenge pumps have higher control accuracy, more reliable stability, and higher efficiency.

United States market for Electric Oil Scavenge Pump is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
