Abstracts

The global Electric Power Industry SF6 and CF4 market size is predicted to grow from US$ 139 million in 2025 to US$ 175 million in 2032; it is expected to grow at a CAGR of 3.4% from 2026 to 2032.

Sulfur Hexafluoride (SF?) is a synthetic inert gas that exists as a colorless, odorless, non-toxic, and non-flammable substance under normal temperature and pressure. It possesses exceptional chemical stability, outstanding electrical insulation properties (with a breakdown strength three times that of air), and highly efficient arc-quenching capabilities (arc-extinguishing speed 100 times faster than air). In the electric power industry, SF? serves as the core insulation and arc-quenching medium for high-voltage/ultra-high-voltage (HV/UHV) power equipment. It blocks discharge paths between electrodes through physical insulation and extinguishes arcs during circuit breaking by leveraging the properties of endothermic decomposition at high arc temperatures and rapid recombination of decomposition products. Compatible with the safe operation requirements of power transmission and distribution systems rated at 110kV and above, as well as medium-low voltage distribution equipment, it is widely applied in key devices such as Gas-Insulated Switchgear (GIS), high-voltage circuit breakers, and Gas-Insulated Transmission Lines (GIL), acting as a critical material for ensuring the reliable power supply of electric power systems. Carbon Tetrafluoride (CF?), also known as tetrafluoromethane, is an inert gas with extremely low natural abundance, primarily produced through industrial synthesis. It is characterized by being colorless, odorless, non-toxic, non-flammable, and exhibiting extremely high chemical stability, along with good electrical insulation properties and thermal stability. In the electric power industry, CF? is mainly used as a special insulation medium or auxiliary gas: on one hand, it can be used alone or mixed with SF?, N?, and other gases for equipment insulation under special operating conditions (such as power electronic

devices in high-temperature and highly corrosive environments); on the other hand, leveraging its stable chemical properties and excellent heat dissipation performance, it is used for insulation filling of high-voltage equipment, auxiliary arc suppression medium, or as a component of low-Global Warming Potential (GWP) alternative gases to SF? (reducing overall greenhouse effect). It is compatible with power system scenarios with high environmental requirements, such as insulation protection for new-type gas-insulated equipment and special transmission lines. In 2024, the global power industry produced 24,287 tons of SF6 and CF4, with an average selling price of US$5.47 per kilogram.

United States market for Electric Power Industry SF6 and CF4 is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Electric Power Industry SF6 and CF4 is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Electric Power Industry SF6 and CF4 is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Global key Electric Power Industry SF6 and CF4 players cover Linde, Resonac, Kemeite Special Gas, Taiyo Nippon Sanso, Kanto Denka Kogyo, etc. In terms of revenue, the global two largest companies occupied for a share nearly % in 2025.
