The global Electric Riding Lawn Mower market size is predicted to grow from US\$ 6551 million in 2025 to US\$ 8752 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

In 2025, the global production of Electric Riding Lawn Mower reached approximately 1.11 million units, with an average global market price of around US\$5,000-\$8,000 per unit. In the same year, the global total production capacity of Electric Riding Lawn Mower reached 1.39 million units. The industry average gross profit margin of this product reached 37%. Electric ride-on lawnmowers are garden maintenance devices powered by electricity and equipped with a rideable control platform. They use a motor to drive a high-speed rotating blade to mow lawns. Compared to traditional fuel-powered ride-on lawnmowers, their core features are low noise, zero emissions, low maintenance costs, and easy start-up. They typically use lithium-ion or lead-acid batteries as their power source and integrate an intelligent control system. They are widely used in large-area home lawns, commercial parks, schools, golf courses, and municipal green space maintenance.

The upstream of the electric ride-on lawnmower industry chain mainly includes the supply of power systems, core components, electronic control modules, and steel and composite materials. The midstream consists of complete machine manufacturers and brand owners, responsible for product design, system integration, assembly testing, and intelligent software development. The downstream includes home users, garden maintenance companies, municipal greening departments, property management companies, and commercial park managers, and sales and services are conducted through offline distributors, e-commerce platforms, and professional garden equipment channels. With the advancement of global 'carbon neutrality' policies and the

accelerated electrification of garden equipment, electric ride-on lawnmowers are experiencing rapid growth, especially in the North American and European markets. Driven by environmental regulations, the penetration rate of electrification continues to increase. At the same time, the improved energy density and reduced cost of lithium batteries have continuously enhanced the product's range. Coupled with intelligent upgrades, the industry is evolving from traditional tools to 'intelligent garden robot platforms.' Future market growth will mainly come from the replacement of existing fuel-powered equipment, the automation upgrade of commercial gardens, and the expansion of the high-end home market.
