The global Electric Road Milling Machine market size is predicted to grow from US\$ 1234 million in 2025 to US\$ 1771 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Electric road milling machine is a kind of construction machinery used for road repair and maintenance. It is powered by electricity and uses high-speed rotating milling blades to cut and mill the road surface. It can effectively remove the surface layer of asphalt or concrete road surface to achieve the purpose of leveling the road surface, removing the old road surface or preparing for new road surface. Compared with traditional fuel-driven, electric road milling machine has the advantages of low operating noise, low emissions, high energy efficiency, etc. It is suitable for places with high requirements for environmental protection and noise control, such as urban roads and bridges.

The electric road milling machine industry chain primarily consists of upstream core component supply, midstream complete machine manufacturing and system integration, and downstream application scenarios and after-sales services: The upstream includes key components such as electric drive systems (motors, controllers, battery packs), hydraulic and transmission systems, milling tools, tires/tracks, and sensors; the midstream is responsible for equipment assembly, electrical and hydraulic system integration, intelligent control software development, and operating interface design by complete road milling machine manufacturers and system integrators, while also providing factory testing and commissioning services; the downstream targets scenarios such as road construction, bridge deck maintenance, airport runways, and urban maintenance, realizing value through sales, leasing, and operation and maintenance services, forming a closed-loop industrial ecosystem of 'component supply—complete

machine manufacturing—application operation—after-sales service'.

In 2025, the average price of electric road milling machines is projected to be US\$42,000 per unit, with sales of 30,023 units and a gross profit margin of approximately 33%.

Electric road milling machines represent the development trend of road maintenance equipment, especially in the context of increasing attention to environmental protection and energy efficiency, electrified equipment has gradually become the mainstream. Compared with traditional fuel milling machines, electric milling machines have the advantages of zero emissions, low noise, and low operating and maintenance costs, and are suitable for construction in environmentally sensitive areas such as urban roads and tunnels. However, its charging requirements and battery life are still challenges that limit its large-scale application. With the advancement of battery technology and the improvement of charging infrastructure, electric road milling machines are expected to gradually replace traditional fuel equipment in the future and promote a more environmentally friendly road maintenance model.
