The electric servo drive bending machine is a CNC bending machine using an electric servo drive system. It uses servo motors and servo controllers to control the movement of machinery to achieve bending processing of metal sheets. The electric servo driven bending machine has the characteristics of high precision, high efficiency and high stability. It can achieve precise angle control and bending force control, and can meet precise requirements for bending angle and bending force. At the same time, the electric servo drive system has the ability to respond quickly and move at high speed, which can improve production efficiency and processing quality. Electric servo-driven bending machines are usually equipped with CNC systems, which are easy to operate and can be programmed to bend metal sheets of different shapes and sizes. Through

the CNC system, the operator can input parameters such as the bending angle and bending strength, and the machine will automatically perform the bending operation according to the set parameters, reducing the complexity and errors of manual operations.
