Electric vessel port charging equipment refers to high-power charging systems deployed on the quayside of ports to provide power to electric or hybrid vessels while they are berthed. This type of equipment enables zero emissions during berthing, reduces fuel consumption, and promotes the electrification of shipping. It typically consists of power conversion units, charging interfaces, control systems, and safety protection modules to ensure the stability, safety, and high efficiency of energy transfer between ports and vessels. The industrial chain for electric vessel port charging equipment includes upstream power electronic devices, transformers, charging connectors, cables, cooling systems, and control software. The midstream includes equipment integration, system assembly, testing, and commissioning. Downstream applications cover commercial ports, passenger terminals, inland waterway shipping, and ship operators. Supporting services include installation, grid connection coordination, system maintenance, software upgrades, and operational support to ensure long-term stable operation of the equipment. In 2025, the global production of electric vessel port charging equipment was approximately 4,364 sets, with a global average market price of approximately US\$220,000 per set. The gross profit margin of major companies in the industry is between 30% and 50%. By 2025, the global production capacity of port charging equipment for electric ships will be approximately 6,000 sets.
