Rail is a vital service to global society and the transport backbone of a sustainable economy.

It has an unprecedented opportunity to achieve the sustainability which is required for the twenty first century. By doing so, Rail will be able to respond to the expected growth in transport demand, both passenger and freight.

The UIC International Railway Research Board (IRRB) has prepared the UIC Global Vision for Railway Development (GVRD) structured around the core themes set out in the strategic documents of the UIC

Regions (e.g. Challenge 2050, Rail Technical Strategy Europe (RTSE), Asia-Pacific Regional Strategy and the strategy paper of the African Region, Destination 2040), as well as other relevant documents such as the Strategic Rail Research and Innovation Agenda (SRRIA) published by ERRAC, the European Rail Research Advisory Council.

The GVRD can help railways develop and optimise rail systems of the future in order to realise opportunities and satisfy customer and societal requirements.

Early machines only lifted the track and packed the ballast. More modern machines, sometimes known as a tamper-liner or tamping and lining machine, also correct the alignment of the rails to make them parallel and level, in order to achieve a more comfortable ride for passengers and freight and to reduce the mechanical strain applied to the rails by passing trains. This is done by finding places where the sleepers have sunk from the weight of the passing trains or frost action, causing the track to sag. The tamper lifts each sleeper and the rails up, and packs ballast underneath. When the sleeper is laid down again, the sagged rails now sit at the proper level. In cases where frost action has caused adjacent rails to rise higher, ballast tampers can raise rails above their original level to make the line level again. 'Lining' rails doesn't involve ballast tamping, it merely ensures the rails are perfectly parallel and straight as possible. Combining tamping and lining into a single machine saves time and money, as only one machine needs to be run over the track to perform both functions.
