The tea picking machine is a crop harvesting machine that picks the fresh and tender tea leaves from the top of the tea tree. According to different picking methods, there are two types of selective tea picking machines and non-selective tea picking machines. Selective tea picking machines are of break-off type and friction type. The former uses the principle of bending and breaking to pick fresh and tender tea leaves and retain the thick and old branches; the latter uses a pair of elastic fingers to clamp the tea leaves, and rely on the static friction between the fingers and the tea leaves to pick off new leaves and retain the old leaves and young leaves. bud. Due to low production efficiency and high requirements for tea garden operating conditions, selective tea picking machines have not been widely promoted.
