The global Electric Thrusters for Ships market size is predicted to grow from US\$ 7977 million in 2025 to US\$ 13980 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

The development of electric thrusters for ships is a growing trend in the maritime industry. Electric thrusters offer several advantages over traditional propulsion systems, including improved efficiency, reduced emissions, and increased maneuverability. One of the main drivers behind the development of electric thrusters is the need to reduce greenhouse gas emissions from the shipping sector. Electric propulsion systems can significantly reduce or eliminate emissions of pollutants such as sulfur oxides (SO_x), nitrogen oxides (NO_x), and particulate matter. This is particularly important as the International Maritime Organization (IMO) has set strict regulations to reduce emissions from ships. Another advantage of electric thrusters is their higher efficiency compared to conventional propulsion systems. Electric motors are more efficient than internal combustion engines, which results in lower fuel consumption and operating costs. This is especially beneficial for long-haul vessels that require large amounts of fuel.
