Electric vehicles generally use high-voltage battery packs to provide power for electric vehicles. In order to ensure the normal on and off of the electrical system, a high-voltage DC relay needs to be configured between the battery system and the motor controller of the electric vehicle. When the system stops running, it acts as isolation. It acts as a connection during operation. When the vehicle is shut down or malfunctions, the energy storage system can be safely separated from the vehicle electrical system to

play a role in breaking the circuit.
