Heat shrink tubing is used to insulate wire providing abrasion resistance and environmental protection for the stranded solid wire conductors with connections, joints and terminals in electrical work. In general, a tube with a lower shrink temperature will shrink faster. When heat shrink tubing is wrapped around wire arrays and electrical components, it collapses radially to fit the contours of the equipment, forming a protective layer. It can protect against abrasion, low impact, cuts, moisture and dust by covering individual wires or encasing entire arrays. Plastic manufacturers begin by extruding a thermoplastic tube to create heat-shrink tubing
