The report requires updating with new data and is sent in 48 hours after order is placed.

Electric vehicle liquid cooling systems are now prevalent across most advanced performance industries as the most compact, sustainable, and efficient method to cool high density heat loads to enable this continual increase in power density. These systems leverage the higher heat capacity of liquid, which absorbs and transports heat at a high rate very efficiently as compared to air cooling or solid conduction. Liquid cooling systems transfer and dissipate extreme heat at a high rate, enabling high compute performance and power density levels that cannot be solved by traditional air-cooled systems.
