Abstracts

According to this study, the global Electrical Discharge Machining Services market size will reach US\$ 17960 million by 2031.

This report focus on Electrical Discharge Machining Services market. Electrical discharge machining (EDM), also known as spark machining, spark eroding, burning, die sinking, wire burning or wire erosion, is a manufacturing process whereby a desired shape is obtained by using electrical discharges (sparks). Material is removed from the work piece by a series of rapidly recurring current discharges between two electrodes, separated by a dielectric liquid and subject to an electric voltage. One of the electrodes is called the tool-electrode, or simply the 'tool' or 'electrode,' while the other is called the workpiece-electrode, or 'work piece.' The process depends upon the tool and work piece not making actual contact.

The EDM process is most widely used by the mold-making tool and die industries, but is increasingly applied to make prototype and production parts, especially in the aerospace and electronics industries in which production requirements are relatively low. EDM is particularly well suited for parts which are made from materials that are difficult to machine and/or contain small or odd-shaped angles, intricate cavities or intricate contours.
