The global Electrical Discharge Machining System market size is predicted to grow from US\$ 2421 million in 2025 to US\$ 3165 million in 2031; it is expected to grow at a CAGR of 4.6% from 2025 to 2031.

Electrical discharge machining (EDM), also known as spark machining, spark eroding, burning, die sinking, wire burning or wire erosion, is a manufacturing process whereby a desired shape is obtained by using electrical discharges (sparks). Material is removed from the work piece by a series of rapidly recurring current discharges between two electrodes, separated by a dielectric liquid and subject to an electric voltage. One of the electrodes is called the tool-electrode, or simply the 'tool' or 'electrode,' while the other is called the workpiece-electrode, or 'work piece.' The process depends upon the tool and work piece not making actual contact.

Electrical Discharge Machining (EDM) systems are high-precision metal machining tools widely used across various manufacturing sectors, including aerospace, automotive, medical devices, and mold-making. The market for EDM systems is currently experiencing steady growth, driven by the ongoing expansion of the manufacturing industry and the increasing demand for high-precision machining. Sales are on the rise, especially in the high-end segment, as businesses increasingly prioritize production efficiency and part quality. In the future, EDM systems are expected to continue evolving, potentially incorporating more automation and intelligence to enhance production efficiency and accuracy, while adapting to the evolving market demands.
