The global Electrically Conductive Composite market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

An electrically conductive composite refers to a material that combines two or more components to create a composite structure with electrical conductivity. These composites are designed to possess both the structural properties of the composite material and the ability to conduct electric current.

There is a rising demand for lightweight materials that possess electrical conductivity in various industries such as aerospace, automotive, electronics, and energy. Conductive polymer composites offer the advantage of combining the mechanical properties of polymers with electrical conductivity, providing a lightweight alternative to traditional conductive materials like metals.
