Abstracts

The global Electrically Driven Sand Mixing Skid market size is predicted to grow from US$ 249 million in 2025 to US$ 807 million in 2032; it is expected to grow at a CAGR of 18.6% from 2026 to 2032.

In 2024, the global production of electric-driven sand mixing skids reached 1,309 units, with an average selling price of US$164,900 per unit, a gross profit margin of 35.68%, and an output of 60 units per skid. Upstream core components include motors and frequency converters. The electric-driven instrument skid integrates electrical drive units (such as motors and frequency converters) and instrument control systems (such as sensors, data acquisition modules, and display terminals) onto a skid-mounted base, forming an independent functional unit. The electric-driven proppant mixing skid is a surface equipment that uses electric drive as its core and a dual-mixing-tank design to achieve efficient mixing of proppant and fracturing fluid, supporting simultaneous fracturing operations in two wells. It adopts a closed structure, achieving "mix and discharge immediately," ensuring strong mixing continuity and effectively solving the problems of overflow and cavitation. With a maximum discharge capacity of 20 m?/min and a maximum proppant delivery rate of 11,500 kg/min, it meets the needs of large-scale shale gas fracturing operations. Equipped with an intelligent control system, it supports remote wired/wireless control and intelligent maintenance, enabling remote and automated proppant mixing operations. It supports both belt conveyor and screw conveyor modes for proppant loading, is compatible with both dry and wet proppant operations, and offers greater application flexibility. It is suitable for large-scale fracturing operations such as shale gas development and tight oil fracturing.
