The global Electrically Heated Constant Temperature Cell Culture Incubator market size is predicted to grow from US\$ 255 million in 2025 to US\$ 367 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

The electric constant temperature cell culture incubator is an instrument that uses an electric heating control device and an adjustable temperature controller to control the temperature. It is mainly used for culturing, preserving and observing biological samples such as cells and microorganisms at a constant temperature. By maintaining the constant temperature of the environment in the box, an ideal growth environment is provided for biological samples. The working principle of the electric constant temperature cell culture incubator is mainly based on the combination of electric heating tube heating and compressor cooling. When the temperature needs to be raised, the heating system starts to work, heats the air through the electric heating tube, and then distributes the hot air evenly in the sample room through the air circulation system, so that the sample temperature gradually increases. When the temperature needs to be lowered, the refrigeration system starts to work, cools the air through compressor refrigeration, and then distributes the cold air evenly in the sample room through the air circulation system, so that the sample temperature gradually decreases. The control system achieves precise control of the entire process by detecting and controlling the temperature.
