The global Electricity Market Support System market size is predicted to grow from US\$ 4534 million in 2025 to US\$ 6524 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

The electricity market support system refers to a comprehensive set of information and software systems used to support electricity market transactions and power system operation. It primarily supports functions such as transaction organization, clearing calculation, dispatch optimization, price formation, settlement and metering, and market supervision for the generation, grid, and consumption sides in the spot market, day-ahead market, real-time market, and ancillary services market. This system typically consists of an electricity market trading platform, a market clearing engine, a load forecasting system, a generation planning optimization system, an ancillary services management system, a metering and settlement system, and a data analysis and monitoring module. It is an indispensable digital infrastructure in the transition of the electricity sector from a 'planned dispatch model' to a 'market-based competition model,' and is widely used in national-level electricity trading centers, grid companies, power generation groups, and regional electricity market operators.

As the global energy structure accelerates its transition towards low-carbon and renewable energy, the electricity market support system is entering a long-term growth cycle, driven by three core factors: First, the ongoing global electricity market reforms are propelling rapid growth in demand for complex market trading and real-time dispatch systems; second, the increasing proportion of intermittent renewable energy sources such as wind and solar power is enhancing the volatility of the power system, further strengthening reliance on real-time clearing, forecasting optimization, and ancillary services market systems; and third, the digital and intelligent upgrading of the

power grid is driving the evolution of the electricity market system from traditional IT systems to an 'AI-driven energy trading operating system.' In the future, this industry will deeply integrate with energy storage dispatch, virtual power plants, and carbon trading market systems to form an integrated market operation platform encompassing 'electricity + carbon + flexible resources.'
